PROPORTIONAL VALVES

Proportional, or electro-proportional valves, provide infinitely variable control of flow, pressure, or direction, in response to a electric input signal.

There are four basic types of Comatrol proportional valves:

- Flow control valves.
- Pressure reducing/relieving valves.
- Pressure relief valves.
- Directional control valves

Proportional valves

PLUS+1™ COMPLIANT

Comatrol solenoid valves are PLUS+1™ compliant. PLUS+1 compliance means our valves are directly compatible with the PLUS+1 machine control architecture. Adding solenoid valves to your application using PLUS+1 GUIDE software is as easy as *drag-and-drop*. Software development that used to take months can now be done in just a few hours. For more information on PLUS+1 GUIDE, visit ***www.comatrol.com*** or *http://powersolutions.danfoss.com/Applications/PLUS1Compliance/index.htm*. The table below details available GUIDE function blocks for controlling Comatrol solenoid valves.

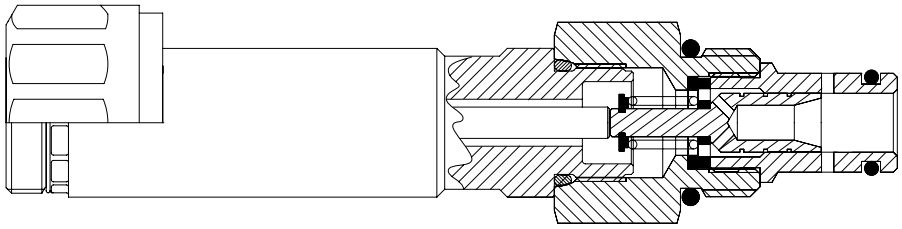
GUIDE function blocks

Two-way proportional	10106103
Three-way proportional	10106104

PROPORTIONAL FLOW CONTROL VALVES

Comatrol proportional flow control valves are 2-way, spool-type valves that are directly operated with a proportional electromagnetic solenoid actuator. By controlling electric current, these valves create an infinitely variable orifice.

Proportional flow control valve

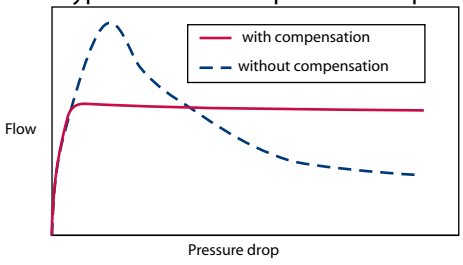


These valves are designed to be used with a logic element to provide pressure compensation. Pressure compensation provides two advantages:

1. A constant pressure differential is maintained across the proportional valve (variable orifice), which maintains constant flow regardless of changes in operating pressure or load.

2. A constant pressure differential across the proportional valve limits the flow forces acting on the valve spool. At high flow and pressure, the electromagnetic and spring forces can be insufficient to maintain valve operation without pressure compensation.

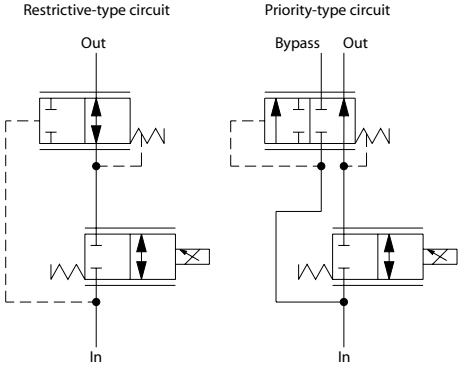
Typical flow versus pressure drop



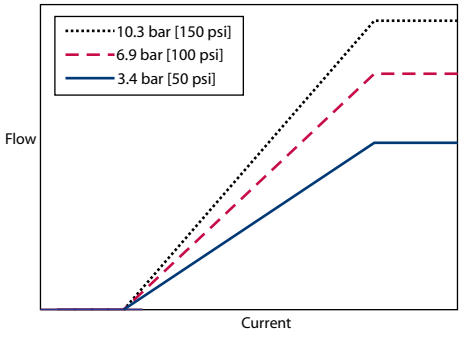
Typical circuits use restrictive-type or priority-type pressure compensators with proportional flow control valves to control speed of a hydraulic motor or cylinder.

Proportional flow control valves are available with a variety of flow capabilities (variable orifice sizes). By matching this flow capability to various pressure compensator settings, a wide range of flow vs. current control curves can be attained.

Typical circuit using a proportional valve



Flow versus current

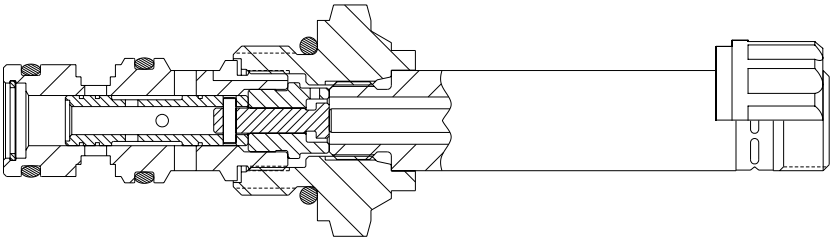


Effect of pressure compensator setting

PROPORTIONAL PRESSURE REDUCING/ RELIEVING VALVES

Proportional pressure reducing/relieving valves are 3-way valves that provide a controlled output pressure as a function of electric current, regardless of system pressure or flow (within the valve's limits). Direct acting designs are available for low-flow applications.

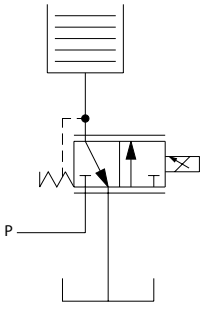
Direct-acting, proportional, pressure reducing valve



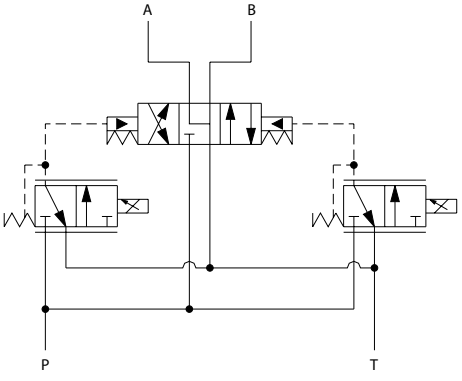
Proportional pressure reducing valves have a variety of applications including:

- Single acting cylinder position control, e.g. combine header height control.
- Clutch or brake pressure control.
- Pilot signal to a directional control valve. By slowly ramping the current to the proportional valve in this example, a soft-start and soft-stop is attained.

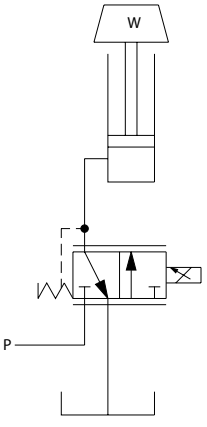
Clutch pressure control



Pilot signal to directional spool valve



Single-acting cylinder piston control



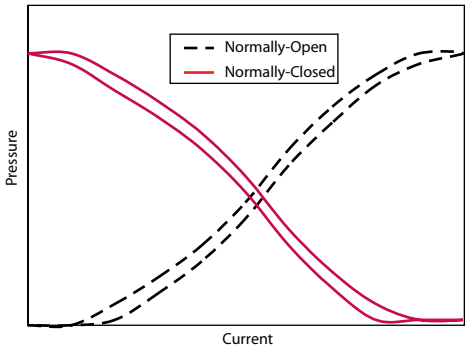
High flow proportional pressure reducing valve functions can be created by using a proportional valve to pilot a differential sensing valve; see differential sensing valve application notes for more information.

PROPORTIONAL PRESSURE RELIEF VALVES

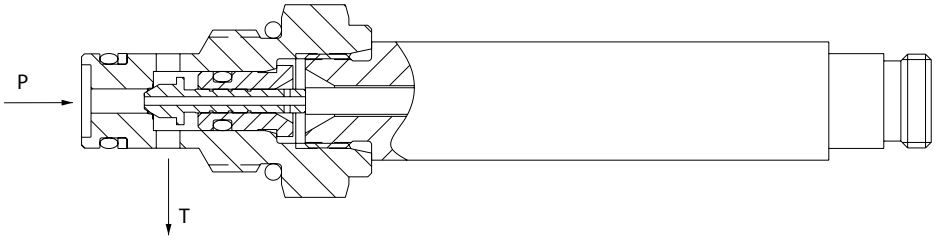
Proportional pressure relief valves are 2-way valves that provide a relief pressure as a function of electric current. Both normally-open (increasing pressure with increasing current), and normally-closed (decreasing pressure with increasing current) are available.

The normally-open proportional relief valve is a direct-acting design for low flow applications. High flow normally-open proportional relief valve functions can be created by using a proportional valve to pilot a differential sensing valve; see differential sensing valve application notes for more information.

Normally closed versus normally open proportional relief valves



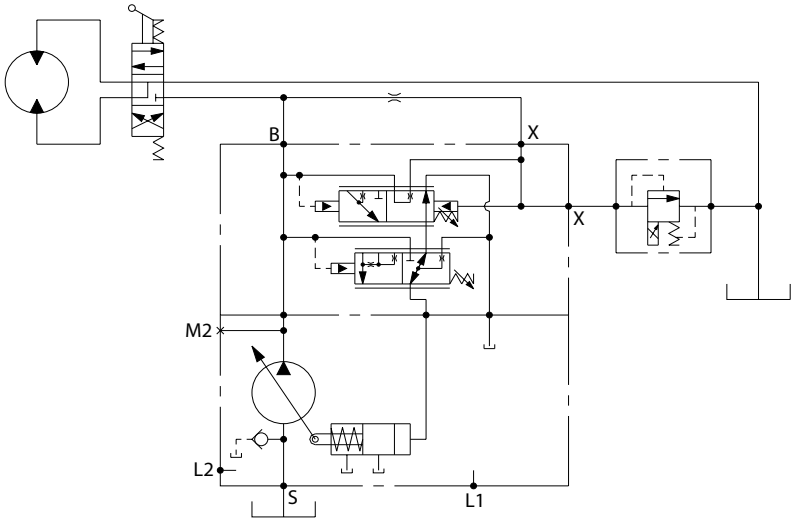
Normally-open proportional relief valve



Common applications for normally-open proportional relief valves are:

- Electro-proportional control of system relief pressure; see differential sensing valve application notes for more information.
- Electro-proportional remote pressure compensator control for open circuit piston pumps (for more information refer to BLN-10128 Series 45 Open Circuit Axial Piston Pumps Technical Information).

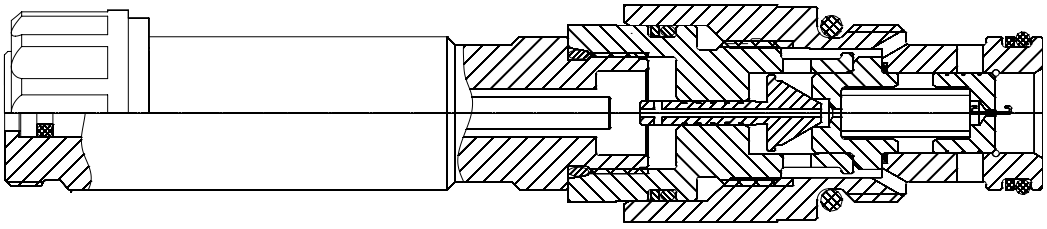
Remote pressure compensator pump control



PROPORTIONAL PRESSURE RELIEF VALVES (continued)

Normally-closed proportional relief valves are available in direct-acting and pilot-operated designs. A direct-acting, normally-closed proportional relief valve is used for low flow applications. For high flow applications, internally pilot-operated cartridges are available.

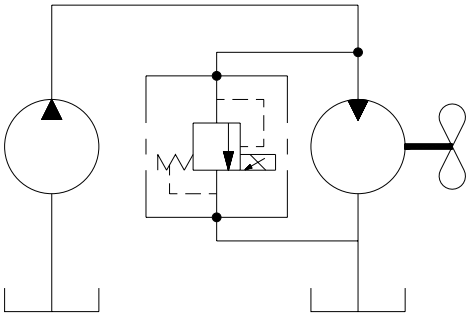
Internally pilot-operated cartridge for high flow applications



Common applications for normally-closed proportional relief valves are:

- Electro-proportional control of system relief pressure or electro-proportional remote pressure compensator control for open circuit piston pumps as above, but where system requirements dictate full pressure with no electrical signal.
- Cooling fan speed control in hydrostatic fan drive systems. (For more information refer to BLN-10080 *Fan Drives Systems and Components Technical Information*).

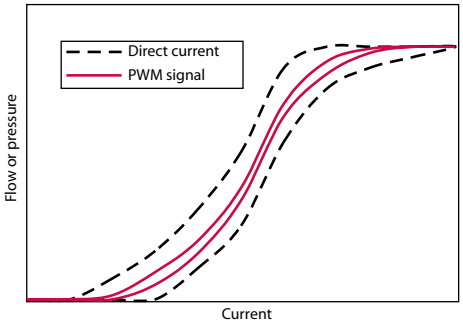
Cooling fan speed control



ELECTRICAL REQUIREMENTS

All proportional cartridge valves are analog-type valves that control flow or pressure as a function of electric current. For this reason, proportional valves should be driven with a current-controlled device that will maintain constant output regardless of changes in system voltage, line losses, or temperature. Typically available current-controlled valve drivers output a pulse-width-modulated (PWM) square-wave signal. An advantage of a PWM signal is that the dither it provides significantly reduces hysteresis. Comatrol recommends using a 100-200 Hz dither for best performance.

Proportional valve hysteresis



Typical performance

TERMS AND DEFINITIONS

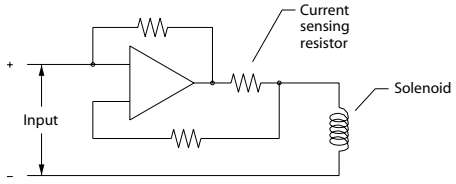
Compensator is a hydraulic component that maintains a constant pressure drop across a fixed or variable orifice.

Current is the flow of electricity through a conductor or coil, normally measured in amps (A). Steady-state current flow in an electrical circuit can be calculated by Ohm's Law, as well as voltage and resistance.

Ohm's Law $I = \frac{V}{R}$

Current Control is a feature of almost all valve drivers. The output of analog proportional valves is a direct function of current. If a valve is controlled with voltage, higher solenoid temperatures, which increase solenoid resistance, will result in lower valve output. To compensate for this, most valve drivers are designed with current feedback circuitry. This means that as solenoid temperature rises or as supply voltage and voltage losses change, the current and corresponding valve output are maintained.

Current feedback circuit



Deadband is the range from zero to the minimum current which causes the valve to respond.

Digital Proportional Valves are extremely fast responding valves that are controlled by a precise on-off signal to produce an average output that is a function of duty cycle.

Dither is a "ripple" signal sent to a solenoid to reduce hysteresis. Dither can be a sine, square, or saw-tooth wave superimposed on a PWM signal or it can be a wave on top of a DC signal.

Duty Cycle is the % of time the valve is on divided by total time.

Hysteresis is the difference in output for a given input, depending on whether the input is increasing or decreasing. It is normally expressed as a % of the maximum rated output. For example, if a 160 l/min 42 US gal/min proportional flow control valve provides 80 l/min 21 US gal/min with 1 amp-increasing and 88 l/min 23 US gal/min at 1 amp-decreasing, the hysteresis is:

$$\frac{(88-80)}{160} = 5\%$$

$\mathbf{I_{min}}$ is the minimum current required for valve response (see deadband).

$\mathbf{I_{max}}$ is the current required for maximum valve output.

Proportional Valves are analog devices controlled by electric current which may be direct current (DC) or a PWM signal.

TERMS AND DEFINITIONS (continued)

PWM is an acronym for Pulse-Width-Modulation. Most valve drivers use a current controlled PWM which produces an average output that is a function of duty cycle in order to reduce valve hysteresis and to allow current control without excessive heat generation. A typical PWM output is a square wave from 80-500 Hz.

Ramping is the application of current to a solenoid with a linear or non-linear ramp, rather than an instantaneous step. Ramping current on and off to a proportional valve provides actuators with soft-starts and soft-stops. Ramps can generally be set or pre-programmed into valve drivers.

Resistance is a component's opposition to the flow of electrical current, usually measured in ohms (Ω). Resistance depends on the conductivity of the material, as well as size, shape, and temperature. Solenoid resistance can vary greatly with temperature; to compensate for this, current-controlled drivers are generally always used with proportional valves.

Threshold is the minimum current required for valve response; see deadband.

Valve Driver is a generic term for any device that sends a signal to a proportional valve. A valve driver may range from a simple electronic circuit attached to a knob or lever up to a microcontroller with custom software and multiple inputs and outputs.

Voltage is the potential for current to flow in an electric circuit, usually measured in volts (V).

MANUAL OVERIDE OPTIONS

MANUAL OVERIDES

Comatrol proportional flow control valves, where noted in the individual catalog pages, have optional manual overrides - "SPS" and "PB" (note that it if the valve has a manual override option, it comes standard with a push-pin style override). The manual overrides are "safety" features for when power is lost and the proportional valve needs to be operated. If using the "SPS" option, the screw-style manual override can be used to proportionally adjust the flow setting when no power is supplied to the coil. When using the "PB" option, the push-button manual override will push to fully open or fully close the valve, which can send full flow, or cut-off the flow to the system. So caution must be taken when applying in a proportional system. The "SPS" proportional control is preferred. The manual overrides, when activated, shift the valve to its energized position.

MANUAL OVERRIDE OPTIONS

Override Activated (mm)	Normal Position (mm)	Size	Order Code	Description
		10, 12, 16 Sizes	OMIT (PN for HSV's)	Standard for any valve with push-pin manual override feature, where indicated in the catalog.
		10, 12, 16 Sizes	PB Push Button	Optional feature for any valve with push-pin manual override.
		10, 12, 16 Sizes	SPS Screw Style (Push Type Valves)	Optional feature for any valve with push-pin manual override. Part number for SPS Manual Override Kit is 272601688.
		04 and 06 Sizes (metric)	EN Screw style	Optional feature for screw adjustment for proportional valves (XMD 04 and XMP 06)

Proportional Directional
PSV10-34-02

Shown with standard coils, DIN connectors

Shown with Robust Coil

OPERATION

This is a proportional, non-compensated, 3 position 4 way, directional flow control solenoid valve, with closed-center spool.

APPLICATIONS

This is an electro-proportional directional control using a 3-Position, 4-Way design for directional control of hydraulic cylinders and motors. For load-independent flow control, apply with a pressure compensator, like CP700-4 (see Example Circuit). Port 1 should be used as the tank port, with a maximum back-pressure of 150 bar. The highest return flow coming from a cylinder should be connected to Port 2.

Use the available Comatrol Adapter Block (SDC10-4-D03 or SC10-4-D03-PC) to help test and replace proportional CETOP D03 - available in compensated or non-compensated. Select the robust coil for those extreme environmental conditions - voltage extremes, high temperature, shock & vibration, chemicals, and/or water ingression.

Note: For optimal performance install with the solenoid valve below the tank oil level in the horizontal position, reducing the chance for trapped air in the valve.

Schematic

Proportional Directional
PSV10-34-05

OPERATION

This is a proportional, non-compensated, 3 position 4 way, directional flow control solenoid valve, with float-center spool.

Shown with DIN connector, standard coil

Shown with Robust Coil

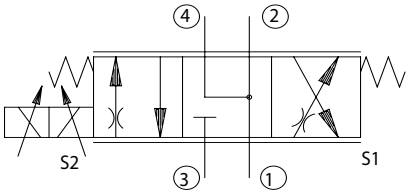
APPLICATIONS

This is an electro-proportional directional control using a 3-Position, 4-Way design for directional control of hydraulic cylinders and motors. For load-independent flow control, apply with a pressure compensator, like CP700-4 (see Example Circuit). Port 1 should be used as the tank port, with a maximum back-pressure of 150 bar. The highest return flow coming from a cylinder should be connected to Port 2.

Use the available Comatrol Adapter Block (SDC10-4-D03 or SC10-4-D03-PC) to help test and replace proportional CETOP D03 - available in compensated or non-compensated. Select the robust coil for those extreme environmental conditions - voltage extremes, high temperature, shock & vibration, chemicals, and/or water ingression.

Note: For optimal performance install with the solenoid valve below the tank oil level in the horizontal position, reducing the chance for trapped air in the valve.

Schematic



SPECIFICATIONS

Rated Pressure*	250 bar [3600 psi]
Maximum Rated Flow at 7 bar [100 psi]	22 l/min [6 US gal/min]
Weight including coil	0.77 kg [1.7 lbs]
Hysteresis	4% maximum
Threshold current	0.5 A (12 VDC coil) 0.25 A (24 VDC coil)
Maximum control current	1.5 A (12 VDC coil) 0.8 A (24 VDC coil)
Cavity	SDC10-4
Standard Coil	M16 26 Watt
Robust Coil	R16 20 Watt Robust Nut P/N 173804910 (no coil O-rings needed)

* Rated Pressure based on NFPA fatigue test standards (at 1 Million Cycles).

Proportional Valves Catalog
Proportional Flow Divider
PFD10-OD

OPERATION

Shown with Deutsch Coils

PDF10-OD: Proportional Flow Divider, 10 Size, Normally Open, Divider
This is a proportional, compensated, normally open, flow dividing, pre-engineered HIC. When there is no current applied to the coils, the inlet flow is divided equally between ports A and B. As an example, if inlet flow is 40 LPM, the flow out Ports A and B will divide equally 20 LPM. The performance curve below shows input flow examples of 40, 20 and 10 LPM. Minimum inlet flow is 10 LPM (2.6 GPM). The flow ratio between ports A and B will proportionally vary as current is provided to coils S1 or S2. As current increases to coil S2, the flow to Port B will proportionally increase, while Port A decreases, as shown in the graph. Inversely, as current increases to coil S1, the flow to Port A will proportionally increase, while Port B decreases.
Note that this is not a combiner, the flow only exits Ports A and B. Connect the drain port DR to tank, limiting the pressure on this port to 50 bar (720 psi).

APPLICATIONS

Proportionally divide the input flow between two motors or hydraulic circuits (like HICs). Circuits that can take advantage of this pre-engineered HIC include any function where the motors or the HICs continuously require flow, and you only need to proportionally manage the amount of flow between them. Achieve repeatable, load-independent flow dividing with the built-in pressure compensator. See performance curve below for compensation capabilities.
Note: For optimal performance, install with the solenoid valve in the horizontal position, reducing the chance for trapped air in the valve.

SPECIFICATIONS

Rated Pressure	230 bar [3335 psi]	
Maximum Rated Flow	40 l/min [10.6 US gal/min]	
Maximum Pressure in Port DR	50 bar [720 psi]	
Minimum Inlet Flow	10 l/min [2.6 US gal/min]	
Weight including Coil	1.15 kg [2.53 lb]	
Coil	M16	26 Watts
Coil Voltage	12 V	24 V
Max. Control Current	1.5 Amp	0.75 Amp
Hysteresis	< 4%

Proportional Valves Catalog
PPR09-POD

Shown with Standard Coil and Filter

Shown with Robust Coil and Filter

OPERATION

Proportional Pressure Reducing / Relieving Valve, Pilot Operated, Normally Open to Drain. With no current to the coil, the "reduced pressure" (port 3) is connected to drain (port 4), while blocking the inlet (port 2). As current is increased to the coil, inlet (port 2) is connected to "reduced pressure" (port 3), proportionally increasing the "reduced pressure" as shown on the performance curve(s). If the "reduced pressure" exceeds the setting induced by the coil, pressure is relieved to drain (port 4). This 09 Series valve uses a 10 size cavity with an 08 size tube and coil, providing an optimal product for high flow and low pressure, while minimizing pressure drop in the system. This valve was formerly branded as XRP 044.

APPLICATION

Common applications include low-pressure proportional pilot control of clutches or hydraulically piloting large directional spool valves. Refer to example circuits. Use the optional screen to help protect the actuator from large particles. Select the robust coil for those extreme environmental conditions – voltage extremes, high temperature, shock & vibration, chemicals, and/or water ingression.

SPECIFICATIONS

Proportional Valves Catalog
Relief, Pilot Operated, Normally Closed
PRV10-POC

OPERATION

This is a normally-closed, pilot-operated, proportional relief valve.

SPECIFICATIONS

Rated pressure	250 bar [3600 psi]
Rated flow	76 l/min [20 US gal/min]
Weight	0.53 kg [1.17 lb]
Hysteresis	10% maximum
Threshold current	0 A (12 VDC coil) 0 A (24 VDC coil)
Maximum control current	1.4 A (12 VDC coil) 0.7 A (24 VDC coil)
Cavity	SDC10-2
Standard Coil	M19P 22 Watt

V	Viton	354000819

*PRV10-IS2 is the same valve as PRV10-POC, with the following differences:
1) The -IS2 uses the M19P-12L or M19P-24L coil (low power)
2) the pressure is set at a higher flow.

The IS2 is designed specifically for fan drive applications where the valve is in a hot ambient engine compartment.
